**Overview**
To install Ototrak module you will need drill with a drill bit 3.2mm, Phillips screwdriver, 10mm wrench and some silicone grease (not silicone spray) for waterproof seal on connectors. Package contains Ototrak module, mounting bracket, screws and Yamaha EX cables.

**Otronik installation position**
Lift up the hood (1) by releasing hood latch. Underneath is a bow storage compartment. Remove storage compartment’s side plastic cover (2) and under the steering (handlebar) you will find all the necessary connectors for power (3), throttle (4) and buzzer (5). Otronik module (6) is installed inside, just under the steering, same as the connectors.

**Connecting Otronik**
Once you have removed compartment’s side cover (2) and installed Otronik, disconnect Yamaha’s power (3) and buzzer (5) cable connections. Disconnect throttle cable (4) from the throttle sensor (7) which is at the bottom of compartment and then connect Otronik cables as shown below.

**NOTE:**
For GPS to work correctly, module must be installed with antenna side (indicated by the IMEI sticker) facing upwards (towards the sky).
